Shen Xiaodan

+86 13763395470 · 123090487@link.cuhk.edu.cn
DOB: Jan 2005 · The Chinese University of Hong Kong, Shenzhen

Education

The Chinese University of Hong Kong, Shenzhen, Computer Science and Technology, *B.E.* Sep 2023 - May 2027

- **GPA:** 3.6/4.0
- **Relevant Courses:** Data Structures, Machine Learning, Deep learning

Aalto University, Computer Science and Technology, *Exchange* Jan 2026 - May 2026

Internship Experience

China Telecom, R&D Intern Jul 2025 - Aug 2025

- **Backend Development:** Developed backend services for an LLM-powered application using Python, designed RESTful APIs, integrated large language model services, and implemented business logic to support end-to-end intelligent workflows.
- **LLM agent Engineering:** Built an automated workflow system based on Dify, optimized Prompt Engineering strategies, integrated external APIs and databases, and improved the reliability and efficiency of AI-generated content for practical engineering scenarios.

Longgang District Artificial Intelligence (Robotics) Office, Intern Jul 2026 - Jul 2026

- **Industry Research:** Conducted research on the artificial intelligence and robotics industries, analyzed technology trends and industrial development, and benchmarked domestic and international AI policies to support government planning.
- **Data Analysis:** Collected, cleaned, and analyzed industry datasets, prepared statistical reports and policy briefs, and provided data-driven insights for policy evaluation, strategic planning, and enterprise development initiatives.

Projects

Multi-Agent Novel Generation System, Personal Project Apr. 2026 – Jul. 2026

Tech Stack: Python, FastAPI, HelloAgents, RESTful API, LLM API, JSON/Markdown

- Developed a multi-agent system with the HelloAgents framework to address outline planning, context loss, and plot inconsistency in long-form novel generation
- Decomposed the writing process into Outline Planning, Chapter Generation, and Content Review agents, and built a "plan–generate–review–memory update" workflow supporting continuous generation from an initial story idea
- Designed structured prompts and a hierarchical context management mechanism incorporating story outlines, historical chapter summaries, and previous chapter content, improving narrative continuity and character consistency across chapters
- Built RESTful APIs with FastAPI for content management and frontend–backend communication, and encapsulated model calls through HelloAgentsLLM to support flexible model switching and decouple LLM services from business logic

Course Selection System, Personal Project Sep. 2025 – Dec. 2025

Tech Stack: React, JavaScript, Java, SQL

- Designed and developed a full-stack course selection system with a separated frontend–backend architecture, addressing delayed course information, scheduling conflicts, and complex enrollment workflows
- Built a responsive user interface with React and JavaScript, and implemented Java backend logic and SQL-based data management to support course search, enrollment processing, real-time course updates, and statistical queries
- Developed an automatic timetable conflict detection and reporting mechanism to identify overlapping courses before enrollment, improving the efficiency and accuracy of students' course selection decisions
- Integrated and tested the frontend and backend components, delivering a stable system with streamlined workflows and a smooth user experience

Research Experience

Parental Influence on Impulsive Consumption Behavior, Researcher Sep 2024 - Dec 2024

- **Situation:** Impulsive buying has become increasingly prevalent among young adults, yet the role of parental spending habits remains underexplored in existing literature
- **Task:** Investigated how parents' spending patterns, financial education, and involvement influence CUHK-SZ students' impulsive consumption behavior
- **Action:** Designed and conducted a mixed-method study involving an online survey of 83 students and four semi-structured interviews; performed data analysis using descriptive statistics and correlation analysis (linear regression, R^2 values)
- **Result:** Identified positive correlation between parents' and students' impulsive buying frequency (R^2=0.242); findings highlighted the need for parental financial education to promote rational consumption; paper accepted and documented in formal research report

Skills

- **Languages:** Proficient in Java, skilled in C/C++ and Python
- **ML/DL:** Familiar with CNN, RNN, GNN; experienced in PyTorch training/tuning
- **English:** TOEFL 108/120
- **Personal Website:** https://shen-xiaodan.github.io/personal-web/

Awards

- Dean's List Award, 2024 & 2025
- College Scholarship, 2025
- Guangdong First Prize, National Mathematical Contest in Modeling, 2025
